awk (english) Cheat Sheet
by TME520 (TME520) via cheatography.com/20978/cs/3902/

| Usage |  |
| :---: | :---: |
| awk [-v var=val] 'program' [file1 file2...] <br> awk [-v var=val] -f progfile [file1 file2...] |  |
| Predefined Variable Summary |  |
| FS | Input Field Separator, a space by default. |
| OFS | Output Field Separator, a space by default. |
| RS | Record Separator, a newline by default. |
| ORS | Output Record Separator, a newline by default. |
| NR | The total Number of input Records seen so far. |
| NF | The Number of Fields in the current input record. |
| FILENAME | The name of the current input file. If no files are specified on the command line, the value of FILENAME is "-". However, FILENAME is undefined inside the BEGIN block (unless set by getline). |
| FNR | Contains number of lines read, but is reset for each file read. |
| \$0 | The whole line. |
| \$1, \$2...\$n | Fields from 1 to $n$. |
| ARGC | The number of command line arguments (does not include options to gawk, or the program source). Dynamically changing the contents of ARGV control the files used for data. |
| ARGV | Array of command line arguments. The array is indexed from 0 to ARGC - 1. |
| ARGIND | The index in ARGV of the current file being processed. |

## Numeric Functions

$\operatorname{atan} 2(y, x) \quad$ Returns the arctangent of $y / x$ in radians.
cos(expr) Returns the cosine of expr, which is in radians.
exp(expr) The exponential function.
int(expr) Truncates to integer.
$\log$ (expr) The natural logarithm function.
rand() Returns a random number N , between 0 and 1, such that $0<=N<1$.

## Numeric Functions (cont)

$\sin ($ expr) Returns the sine of expr, which is in radians.
sqrt(expr) The square root function.
srand([expr]) Uses expr as a new seed for the random number generator. If no expr is provided, the time of day is used. The return value is the previous seed for the random number generator.

## Bit Manipulation Functions

| and(v1, v2) | Return the bitwise AND of the values provided by <br>  <br> v1 and v2. |
| :--- | :--- |
| compl(val) | Return the bitwise complement of val. |
| Ishift(val, count) | Return the value of val, shifted left by count bits. |
| or(v1, v2) | Return the bitwise OR of the values provided by <br> v1 and v2. |
| rshift(val, count) | Return the value of val, shifted right by count bits. <br> xor(v1, v2) |
|  | Return the bitwise XOR of the values provided by <br>  |

## String Functions

asort(s [, d]) Returns the number of elements in the source array s. The contents of s are sorted using gawk's normal rules for comparing values, and the indexes of the sorted values of $s$ are replaced with sequential integers starting with 1 . If the optional destination array $d$ is specified, then $s$ is first duplicated into $d$, and then $d$ is sorted, leaving the indexes of the source array s unchanged.

[^0]$\left.\begin{array}{ll}\hline \text { String Functions (cont) } \\ \hline \text { asorti(s [, d]) } & \begin{array}{l}\text { Returns the number of elements in the source } \\ \text { array } s . \text {. The behavior is the same as that of } \\ \text { asort(), except that the array indices are used }\end{array} \\ & \text { for sorting, not the array values. When done, } \\ \text { the array is indexed numerically, and the values } \\ \text { are those of the original indices. The original } \\ \text { values are lost; thus provide a second array if } \\ \text { you wish to preserve the original. }\end{array}\right\}$

## String Functions (cont)

index(s, t)
length([s])
match(s, $\mathrm{r}[, \mathrm{a}])$ or 0 if t is not present (this implies that character indices start at one).
length([s]) Returns the length of the string s, or the length of $\$ 0$ if $s$ is not supplied.
match(s, r[, a]) Returns the position in $s$ where the regular expression $r$ occurs, or 0 if $r$ is not present, and sets the values of RSTART and RLENGTH. Note that the argument order is the same as for the $\sim$ operator: str $\sim$ re. If array a is provided, a is cleared and then elements 1 through $n$ are filled with the portions of $s$ that match the corresponding parenthesized subexpression in r . The 0'th element of a contains the portion of $s$ matched by the entire regular expression $r$. Subscripts a[n, "start"], and a[n, "length"] provide the starting index in the string and length respectively, of each matching substring.
split(s, a [, r]) Splits the string sinto the array a on the regular expression $r$, and returns the number of fields. If $r$ is omitted, FS is used instead. The array a is cleared first. Splitting behaves identically to field splitting.
sprintf(fmt, expr-list) Prints expr-list according to fmt, and returns the resulting string.

awk (english) Cheat Sheet
by TME520 (TME520) via cheatography.com/20978/cs/3902/

| String Functions (cont) |  |
| :---: | :---: |
| strtonum(str) | Examines str, and returns its numeric value. If str begins with a leading 0 , strtonum() assumes that str is an octal number. If str begins with a leading $0 x$ or OX, strtonum() assumes that str is a hexadecimal number. |
| $\operatorname{sub}(\mathrm{r}, \mathrm{s}[, \mathrm{t}])$ | Just like gsub(), but only the first matching substring is replaced. |
| substr(s, i [, n]) | Returns the at most $n$-character substring of $s$ starting at i . If n is omitted, the rest of s is used. |
| tolower(str) | Returns a copy of the string str, with all the uppercase characters in str translated to their corresponding lower-case counterparts. Non-alphabetic characters are left unchanged. |
| toupper(str) | Returns a copy of the string str, with all the lowercase characters in str translated to their corresponding upper-case counterparts. Non-alphabetic characters are left unchanged. |

## I/O Statements

close(file [, how]) Close file, pipe or co-process. The optional how should only be used when closing one end of a two-way pipe to a co-process. It must be a string value, either "to" or "from".
getline Set $\$ 0$ from next input record; set NF, NR, FNR. Returns 0 on EOF and 1 on an error. Upon an error, ERRNO contains a string describing the problem.

| I/O Statements (cont) |  |
| :---: | :---: |
| getline <file | Set \$0 from next record of file; set NF. |
| getline var | Set var from next input record; set NR, FNR. |
| getline var <file | Set var from next record of file. |
| command \| getline [var] | Run command piping the output either into $\$ 0$ or var, as above. If using a pipe or co-process to getline, or from print or printf within a loop, you must use close() to create new instances. |
| command \|\& getline [var] | Run command as a co-process piping the output either into $\$ 0$ or var, as above. Co-processes are a gawk extension. |
| next | Stop processing the current input record. The next input record is read and processing starts over with the first pattern in the AWK program. If the end of the input data is reached, the END block(s), if any, are executed. |
| nextfile | Stop processing the current input file. <br> The next input record read comes from the next input file. FILENAME and ARGIND are updated, FNR is reset to 1 , and processing starts over with the first pattern in the AWK program. If the end of the input data is reached, the END block(s), are executed. |
| print | Prints the current record. The output record is terminated with the value of the ORS variable. |
| print expr-list | Prints expressions. Each expression is separated by the value of the OFS variable. The output record is terminated with the value of the ORS variable. |

| strftime([format [, timestamp]]) | Formats timestamp according to the <br> SS[ DST]. <br> specification in format. The |
|  | timestamp should be of the same <br> form as returned by systime(). If |
|  | timestamp is missing, the current <br> time of day is used.If format is |

## GNU AWK's Command Line Argument Summary

## -v var=val or--assign var=val Assign the

Use fs for the input field separator (the value of the FS predefined variable).
value val to
the variable
var, before
execution of
the program
begins. Such
variable
values are
available to
the BEGIN
block of an
AWK
program.
Read the
AWK program source from the file progra-$m$-file, instead of from the first command line argument.
Multiple -f (or -
-file) options may be used.

Set various memory limits to the value NNN. The f flag sets the maximum number of fields, and the $r$ flag sets the maximum record size (ignored by gawk, since gawk has no pre-defined limits).

| -W compat or-W traditional or --compat--traditional | Run in compatibility mode. In compatibility mode, gawk behaves identically to UNIX awk; none of the GNU-specific extensions are recognized. |
| :---: | :---: |
| -W dump-variables[-file] or --dump-variables[=file] | Print a sorted list of global variables, their types and final values to file. If no file is provided, gawk uses a file named awkvars.out in the current directory. |
| -W help or -W usage or --help or--usage | Print a <br> relatively short summary of the available options on the standard output. |
