

Vocabulary

Variable	Hold a value and be change
String	A list of character such as number, letter and symbols
Integer number	Whole number/counting number
Float number	The number in decimal
Syntax	Grammar/Structure of language
Modulo	Find the remainder
Boolean	True/False

Function

print()	Show the information that you want on the screen
int()	Change number to be number integer
float()	Change number to be decimal number
input()	Gain information from user
str()	A list of number, letter and symbols
len()	The length of the string
#	Comment, no effect

Forever While Loop

```
while True: # forever
    use r_input =
input( 'Enter a number: ')
    number = int(us er_ -
input)
    print ('The number
squared is', number ** 2)
```

Conditional While Loop

```
count = 0 # start at zero
while count < 10: # loop while
count is less than 10
    pri nt( count) #will
print numbers 0 - 9
    count = count + 1 # must
increase count
```

Lists

Lists (cont)

```
> mylist.append(5) # adds an item to the
end of the list
```

Multiplication and Exponents

string * number	Combine that string
string* string	CRASH!
number * number	Multiply (Math)
string ** string	CRASH!
number ** number	Exponent (Math)
string ** number	CRASH!

Math

==	equal to
!=	no equal to
<	less than
>	more than
<=	less than or equal to
>=	more than or equal to
%	Modulo, Find the remainder

Addition

string + string	Combine together
string + number	CRASH!
number + number	Addition (Math)

Convert number to hexadecimal

Convert number to hexadecimal (cont)

```
> elif remainder == 15:
    remainder = 'F'
    hex_string = str(remainder) +
hex_string #remainder + hex string
    number = number // 16#must use //
when you divide
    #after the loop print the hex string
    print ("Hexadecimal string is 0x" +
hex_string)
    #expected output - 5 = 101
    #excepted output - 3 = 11
    #excepted output - 2 = 10
```

Reverse Word

```
while True:
word = input("Please enter a word")
index = 0
reverse = ''
while int(index) < len(word):
reverse = word[index] + (reverse)
index = int(index) + 1
print ("Reverse: ", reverse)
```

Create function

```
# how to create a function
def nameOf Fun ction (myvar1,
myvar2): # parameters or argu
ments
    print ("he llo ") #must
indent each line that is part of
the function
    return myvar1 + myvar2
# function call
nameOf Fun ction ('hi', 'there')
# a value for each argument
#write a function
# name : areaOf Tri angle
# parameters : base height
# return : area
def areaOf Tri angle (base,
height):
    area = 0.5*ba se* -
height
    return area
```

```
mylist = [2,3,4,5] # create a
list
#select an item from a list
print (mylist[0]) #selects
first item and displays 2
# len() determines the length of
the list
print (len(mylist)) # displays
4
```

```
while True:
#get a number from the user
    use_number =
input( " Please enter a number:
")
    #convert to integer
    number = int(user_
number)
    hex_string = ''
    while (number > 0):#the
number is greater than 0)
        remainder =
number % 16 #use Modulo %
        if remainder ==
10:
            rem_
ainder = 'A'
        elif remainder ==
11:
            rem_
ainder = 'B'
        elif remainder ==
12:
            rem_
ainder = 'C'
        elif remainder ==
13:
            rem_
ainder = 'D'
        elif remainder ==
14:
            rem_
ainder = 'E'
```

Decision Making/Conditional Statements

```
if 3 < 2: #if statement must
compare two Booleans
    print ('3 is less than
2')
elif 4 < 2: #can have 0 or more
elif statements
    print ('4 is less than
2')
elif 5 < 2:
    print ('5 is less than
2')
else: #can have 0 or 1 else
statement at the end
    print ('none of the
above are True')
```
