

### Dataframe 1

```
data.frame(data, row.names =
NULL,...)
data.frame(name1 = vector1,
name2 = vector2,...)
> vec1<-c( 25, 24, 21, 23, 22)
> vec2<-c("M", "F", "F", "M", "F")
> vec3<-
c("A1", "A2", "A3", "A1", "A2")
> (df1 <- data.frame(age=vec1,
sex=vec2, group=vec3))
  age sex group
1 25 M A1
2 24 F A2
3 21 F A3
4 23 M A1
5 22 F A2
```

(\*\*Basics)

### Dataframe 2

```
is.object(df1)      TRUE
typeof(df1)         "list"
class(df1)           "data.frame"
sloop::otype(df1)   "S3"

df1[c(1,2)]         Subsetting
df1[[2]]
df1[["sex"]]
df1$sex
```

(\*\*Basics)

### Dataframe 3

Important functionality:

```
str(df1)
attributes(df1)
merge()
merge by common columns or row names
cbind() rbind()
head()
visualize the first rows of a df
attach()
df can be attached
summary()
basic statistics
```

(\*\*Basics)

### Dataframe 4

Dataframes can contain lists:

```
1) df <- data.frame(x=1:3); df$y <- list(1:2, 3:4)
2) df <- data.frame(x = 1:3, y = I(list(1:2, 1:3, 1:4)))
```

Can be also matrices:

```
dfm <- data.frame(x = 1:3 * 10)
dfm$y <- matrix(1:9, nrow = 3)
dfm$z <- data.frame(a = 3:1, b = letters[1:3])
```

(\*\*Adanced)

### Tibbles 1

Part of the tidyverse  
More flexible than datasets:  

```
(tib0<-tibble(x = 1:3, y = 1, z =
name = letters[1:3], lis = list(1:
```

Can be more rigid: recycling  

```
(tib2 <- tibble::tibble(age=1, sex
```

(\*\*Basics)

### Tibbles 2

```
attributes(tib0)    $names,
                   $row.names,
                   $class
mode(tib0)          "list"
typeof(tib0)         "list"
class(tib0)          "tbl_df"
typeof(tib0)         "S3"
is_tibble()          Test if tibble
as.data.frame()      Convert to df
tibble()             Table format
```
