

Good things, easy to do

Add a new column

Drop a column

Add an index concurrently (`LOCK=NONE`, may or may not work)

Drop a constraint (for example, non-nullable)

Add a default value to an existing column (again, `LOCK=NONE`)

Changing Column Type

Add migration to create new temporary column with wanted type

Ship that migration

Add trigger/code path to write to both columns

Ship that code

Add migration to copy data *in chunks* from old column to new one

Ship that migration

Add migration to rename temporary column
